

Submission Overview

Task A and Task B — what was built, where it is live, and how to run it

Two tasks for the Digital Heroes full stack assessment. Each folder is a standalone project with its own README, tests, and CI.

	LIVE	SOURCE
Task A — Leadline	https://leadline-feen.onrender.com	task_a/ · README
Task B — Handover	https://crateful-handover.onrender.com	task_b/ · README

Both are hosted on a free tier, so the first request after ~15 idle minutes takes 30–50 seconds to wake the server.

Task A — build a lead management platform

A public capture form, a role-based team app, a drag-and-drop pipeline board, and a documented JSON API — Next.js 15, Prisma on SQLite/Turso, JWT cookie sessions, 40 Vitest cases.

The pipeline rules (which stage moves are legal, how a lead is scored) are pure functions that import nothing, and every screen calls the same API an external client would, so the UI cannot bypass a rule the server enforces. Every mutation writes its audit row in the same transaction as the change. `GET /embed.js` drops the capture form onto any website with one script tag.

Sign in as `admin@leadline.demo` / `Admin@1234`, or `member@leadline.demo` / `Member@1234`.

BASH

```
cd task_a && npm install && cp .env.example .env # set AUTH_SECRET to any long random string
npx prisma db push && npm run db:seed && npm run dev
```

Task B — inherit and improve a legacy codebase

Four documents on taking over a working but badly built system that serves real customers and cannot go down: an [assessment](#) of nine findings ranked by harm, a [migration plan](#) where every step is shippable and reversible, [the refactor](#), and ten machine-enforced [standards](#).

The refactor is real code, not a sketch: one 40-line handler rebuilt, with 29 tests that run — eight against **both** the old and new implementation to prove a customer cannot tell the difference, the rest demonstrating six defects removed, including a missing ownership check, SQL concatenation, and a retry that double-charged.

BASH

```
cd task_b && npm install && npm test
```

Every push runs both test suites and a production build in GitHub Actions ([ci.yml](#)).
