

Overview

Inheriting a working but badly built codebase that serves real customers and cannot go down

The codebase

A direct-to-consumer coffee subscription. 11,000 subscribers, about £320k a month, four engineers, six years of code. Next.js, Postgres behind Supabase, Stripe, deployed to one VPS.

It works and it earns money. It also has:

- no tests and no CI
- business logic inside route handlers
- the browser querying the database directly
- live payment and database credentials committed to the repo

It serves real customers today and it cannot go down.

The four documents

1. Assessment	Nine findings, ranked by harm, with the cost of leaving each one and the risk of fixing it
2. Migration plan	What ships in week 1, month 1 and quarter 1. Every step small, shippable and reversible
3. The refactor	One bad handler rebuilt, with tests proving the behaviour survived and six defects did not
4. Standards	Ten rules, each enforced by a machine, and how to get a resistant team to adopt them

Running the refactor

```
git clone https://github.com/suryanshishere/Full_Stack_Developer_Suryansh_Singh
cd Full_Stack_Developer_Suryansh_Singh/task_b
npm install
npm test
```

BASH

29 tests, no database and no network.
